Week 10

Working with graphs

- Graph $G = (V, E)$
  - V — set of vertices
  - $E \subseteq V \times V$ — set of edges
- A path is a sequence of vertices $v_1, v_2, \ldots, v_k$ connected by edges
  - For $1 \leq i < k$, $(v_i, v_{i+1}) \in E$
- Vertex v is reachable from vertex u if there is a path from u to v

  - For $1 \leq i < k$, $(v_i, v_{i+1}) \in E$
- Vertex v is reachable from vertex u if there is a path from u to v
- Looking at the picture of G, we can "see" that v_0 is reachable from v_9

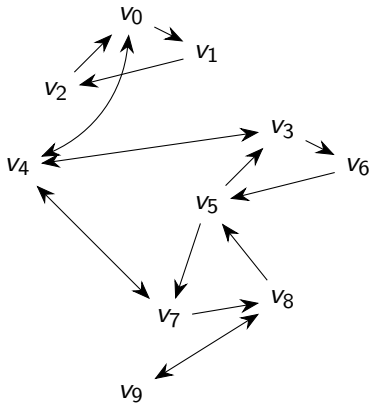
- Looking at the picture of G, we can "see" that v_0 is reachable from v_9
- How do we represent this picture so that we can compute reachability?

Airline routes



Adjacency matrix

- Let $|V| = n$
  - Assume $V = \{0, 1, \ldots, n-1\}$
  - Use a table to map actual vertex "names" to this set

Adjacency matrix

- Let $|V| = n$
  - Assume $V = \{0, 1, \ldots, n-1\}$
  - Use a table to map actual vertex "names" to this set
- Edges are now pairs (i, j), where $0 \leq i, j < n$
  - Usually assume $i \neq j$, no self loops

Checking reachability

- Mark source vertex as reachable
- Systematically mark neighbours of marked vertices
- Stop when target becomes marked
- Need a strategy to systematically explore marked neighbours
- Two primary strategies
  - Breadth first — propagate marks in "layers"
  - Depth first — explore a path till it dies out, then backtrack

Adjacency lists

- Adjacency matrix has many 0's
  - Size is n^2, regardless of number of edges
  - Undirected graph: $|E| \leq n(n-1)/2$
  - Directed graph: $|E| \leq n(n-1)$
  - Typically $|E|$ much less than n^2

Summary

- To operate on graphs, we need to represent them
- Adjacency matrix
  - $n \times n$ matrix, $A[i,j] = 1$ iff $(i,j) \in E$
- Adjacency list
  - For each vertex i, list of neighbours of i
- Can systematically explore a graph using these representations
  - For reachability, propagate marking to all reachable vertices
